

A Career as a Architect: Guidance for Senior High School Students

The Architect career suits students whose strongest interests on the Holland RIASEC model are Investigative and Artistic, with a practical Realistic streak. The day-to-day work of a Architect rewards systematic problem-solving: examining a problem from several angles, imagining possible answers, and testing each one against reality. Students who enjoy working out why things are the way they are, and who also like making new things, tend to find this work deeply satisfying.

In the Philippines, the road to becoming a Architect runs through a relevant college degree, board or licensure requirements where applicable, and early hands-on practice. Students from the STEM strand arrive well prepared for the quantitative parts of the coursework. A general weighted average of 85 or above signals readiness for a rigorous program, though motivated students below that line succeed regularly.

Employment prospects for a Architect remain strong, with entry-level salaries that grow quickly with specialization and experience. Students considering this path should take every related elective available, seek out a club or competition in the field, and finish one small real project before graduation - the habit of finishing is the single strongest predictor of success in college and beyond.
